

Lecture Homework Week 06 - Tuesday

Student Information

Name: Hannah Hwang

NetID: hhwan038

Student Responses

Answer the following questions, and be sure to highlight them when you turn them in on Gradescope.

For part (1), below answer why the program does not work when you comment out the line BL copy_vector:

Commenting out **BL copy_vector** prevents the program from copying the vector table to address 0. This results in the program seeing and trying to execute garbage data when an interrupt occurs resulting in a system crash.

For part (2), below answer why moving the vector table to the beginning of the start.s file still works after recompiling:

Moving the vector table to the beginning of **start.s** works because it ensures that the vector table is physically placed at the correct address upon loading. This eliminates the need for the **copy_vector** function since the vector table is already pre-installed in the correct memory location.

* I was getting "core aborted" errors when running with just the specified changes, and had to edit the loading address in linker-script to 0x0 for the program to work without crashing.
